

RNA-only predictions remain compressed toward the middle

28 independent materials; 15 source-connected held-out folds; expanded scar + tendon RNA references

Dashed line: perfect prediction; shading: ± 5 percentage points (visual guide)

Error by held-out source

Each source counts once: mean MAE 8.74 pp without RNA vs 9.16 pp with RNA

The outcome is a detected KLa-bearing protein fraction, not site occupancy. RNA reference expansion adds no new protein-labeled material.
